BGP LAB PREPEND

L'AS path prepending serve a determinare il best path per l'inbound traffic. Sapendo che il percorso utilizzato è sempre quello che attraversa il minor numero di AS, la tecnica consiste nell'iniettare più volte nell'AS path il proprio AS per i percorsi da discriminare.

//dall'esercizio di prima copiamo le configurazioni delle interfacce e OSPF//

//Configuriamo le interfacce dei router//

/usr/share/doc/easy-rsa/
```

tramite gestore file andate nella vostra home e aprite openvpn-ex1

aprire config-files

aprire client.conf

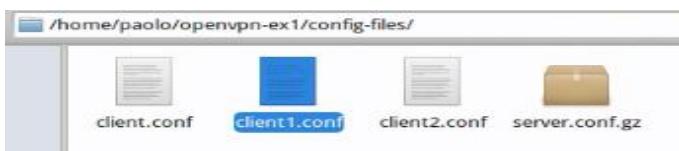

salva con nome e rinominare con client1.conf

```
# You can have multiple remote entries
# to load balance between the servers.
remote my-server-1 1194
;remote my-server-2 1194
```

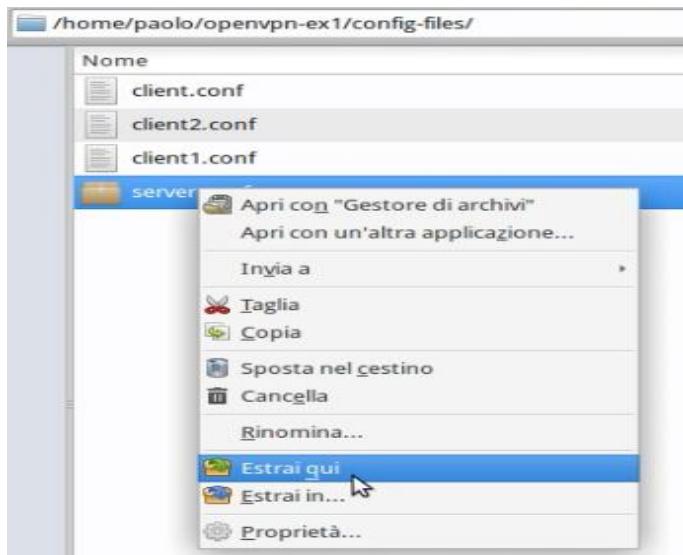

sostituire my-server-1 con 160.0.0.1

```
# You can have multiple remote entries
# to load balance between the servers.
remote 160.0.0.1 1194
;remote my-server-2 1194
```

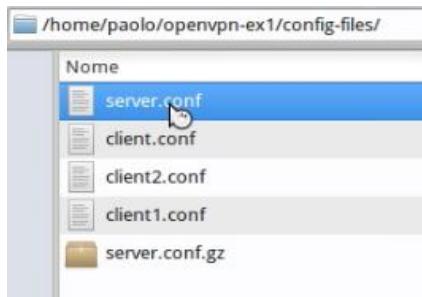

salviamo e successivamente salviamo con nome e rinominiamo client2.conf alla fine dovranno risultare queste cartelle.

andare su /home/paolo/openvpn-ex1/config-files

scompattare server.conf

aprire server.conf

```
server.conf - Mousepad
File Modifica Visualizza Testo Documento Navigazione Aiuto
# duress pool (10.0.0.0/255.255.255.0)
# back to the OpenVPN server.
;push "route 192.168.10.0 255.255.255.0"
;push "route 192.168.20.0 255.255.255.0"
```

trovare la riga con la scritta 'push' e aggiungere:

```
;push "route 192.168.10.0 255.255.255.0"
;push "route 192.168.20.0 255.255.255.0"
push "route 192.168.0.0 255.255.255.0"
push "route 192.168.1.0 255.255.255.0"
```

trovare la seguente riga:

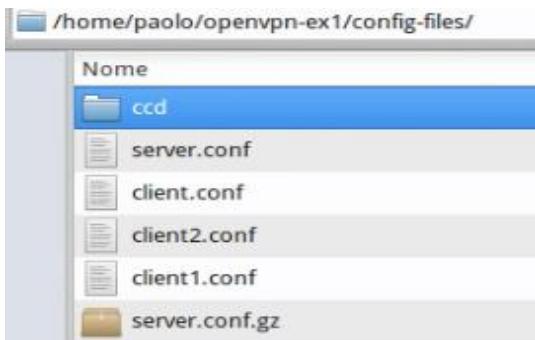

```
;client-config-dir ccd
;route 192.168.40.128 255.255.255.248
```

e sostituirla con

```
client-config-dir ccd
route 192.168.1.0 255.255.255.0
```

andare su /home/paolo/openvpn-ex1/config-files

creare una nuova cartella chiamandola 'ccd'

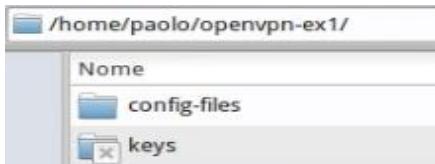

aprire ccd e creare il file client1

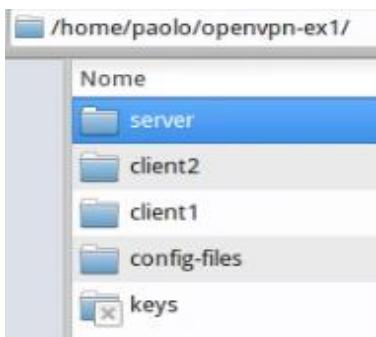

all'interno di client1 andiamo a scrivere:

```
iroute 192.168.1.0 255.255.255.0
```

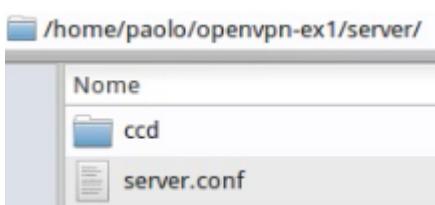

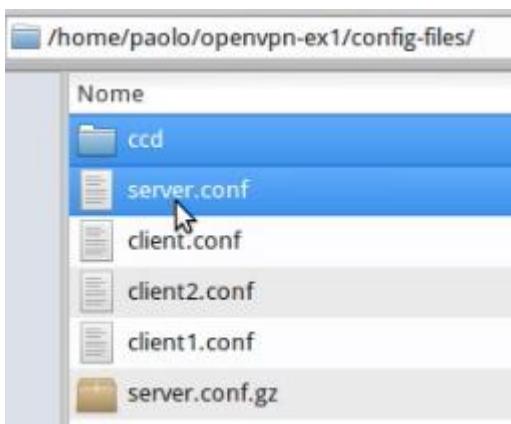

andare su /home/paolo/openvpn-ex1/

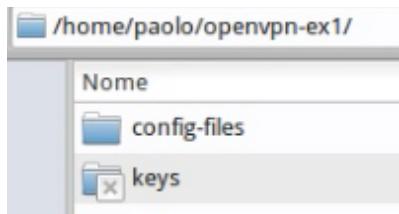

e creare le seguenti cartelle: client1, client2, server

dalla cartella config-files spostare nella cartella server : 'ccd' e 'server.conf'

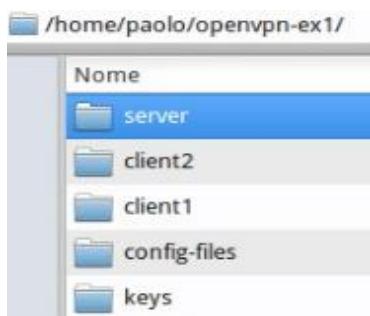

Rendere accessibile la cartella keys presente in openvpn-ex1

aprire il terminale e digitare il percorso dove è presente openvpn-ex1
nel mio caso:

```
paolo@paolo-Aspire-5750G:~$ sudo su
root@paolo-Aspire-5750G:/home/paolo# cd openvpn-ex1/keys
root@paolo-Aspire-5750G:/home/paolo/openvpn-ex1/keys# chown -R paolo:paolo keys
```

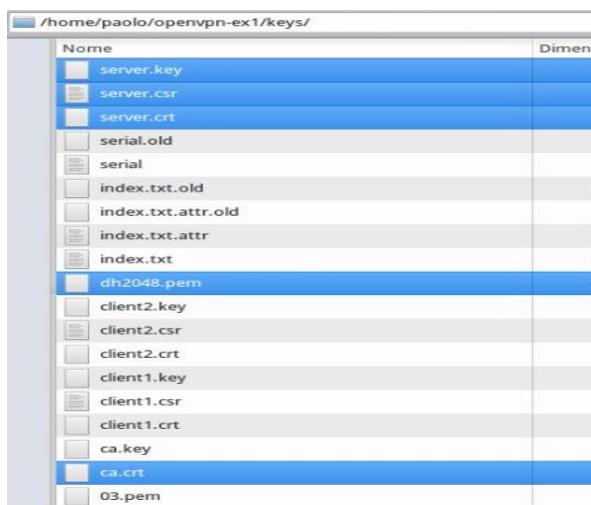

possiamo notare che la cartella keys non ha più la 'x'

Configurazione Server

aprire la cartella keys e selezionare i seguenti file:

server.key server.csr server.crt dh2048.pem ca.crt

e copiarli nella cartella server

aprire server.conf e cercare:

```
# 2048 bit keys.
dh dh1024.pem
```

sostituire << dh dh1024.pem>> con il nome del file presente nella cartella server

```
# 2048 bit keys.
dh dh2048.pem
```

trovare anche:

```
# SERVER'S TUN/TAP IN
;client-to-client
```

```
# Uncomment this directive to
#
```

sostituire con:

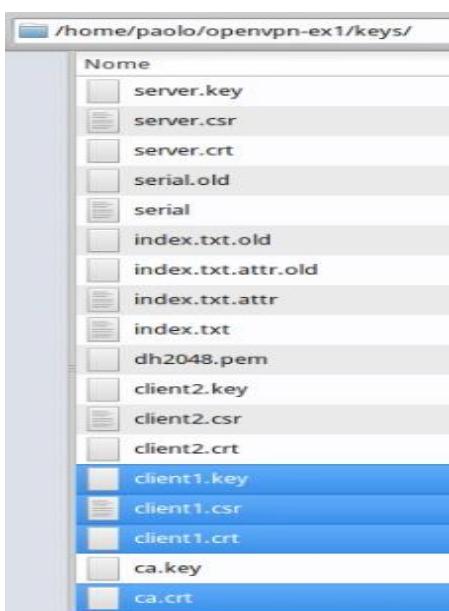

```
# SERVER'S TUN/TAP IN
client-to-client
```

```
# Uncomment this directive to
#
```

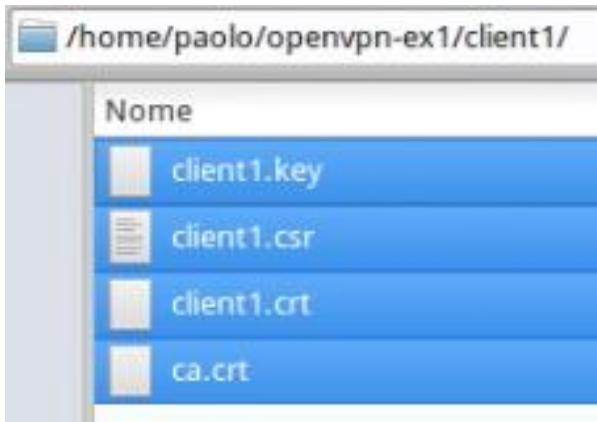

Configurazione Client1

tornare nella cartella keys e copiare:

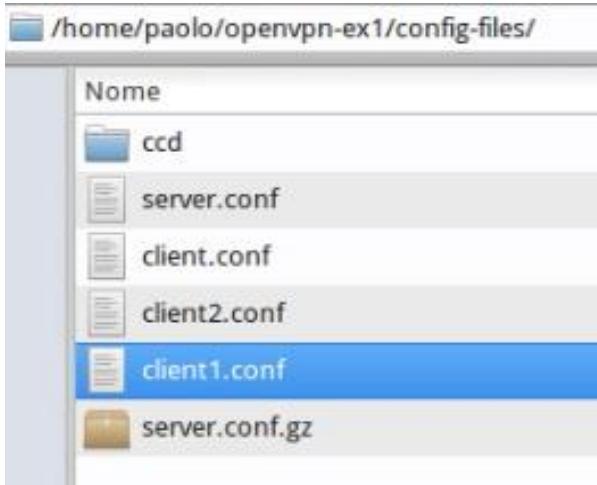

client1.key client1.csr client1.crt ca.crt

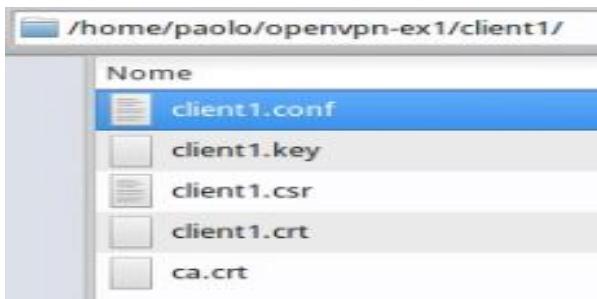

e copiarli all'interno della cartella client1

andare all'interno della cartella config-files e copiare il file client1.conf

copiare il file client1.conf all'interno della cartella client1

aprire client1.conf e sostituire:

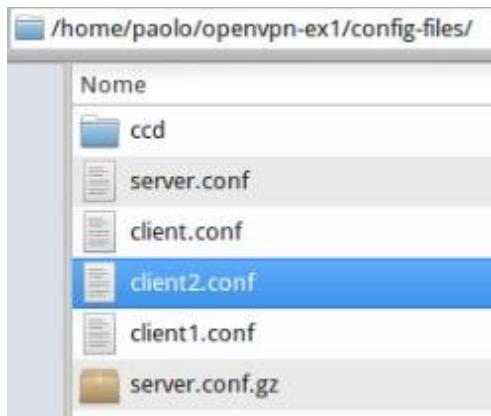

```
# This can be used
ca ca.crt
cert client1.crt
key client1.key
```

con:

```
ca ca.crt
cert client1.crt
key client1.key
```

Configurazione Client2

andare all'interno della cartella config-files e copiare il file client2.conf

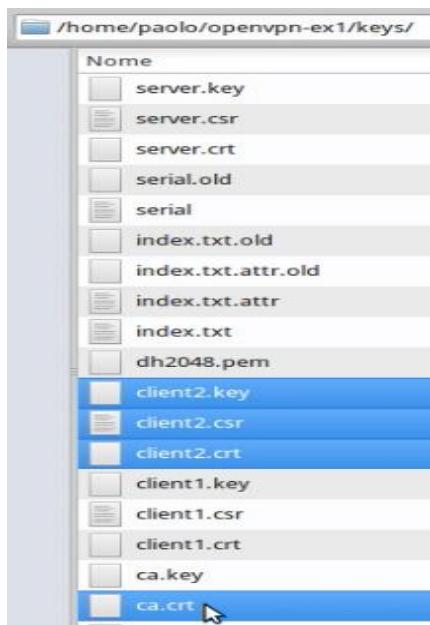

copiare il file client2.conf all'interno della cartella client2

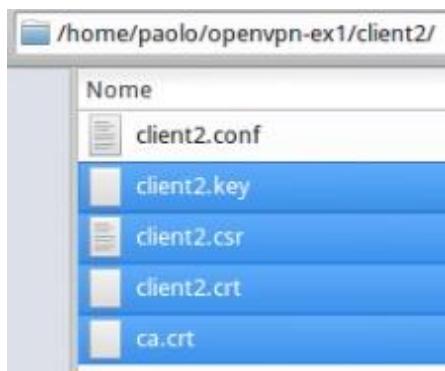

tornare nella cartella keys e copiare:

client2.key client2.csr client2.crt ca.crt

copiare il tutto all'interno della cartella client2

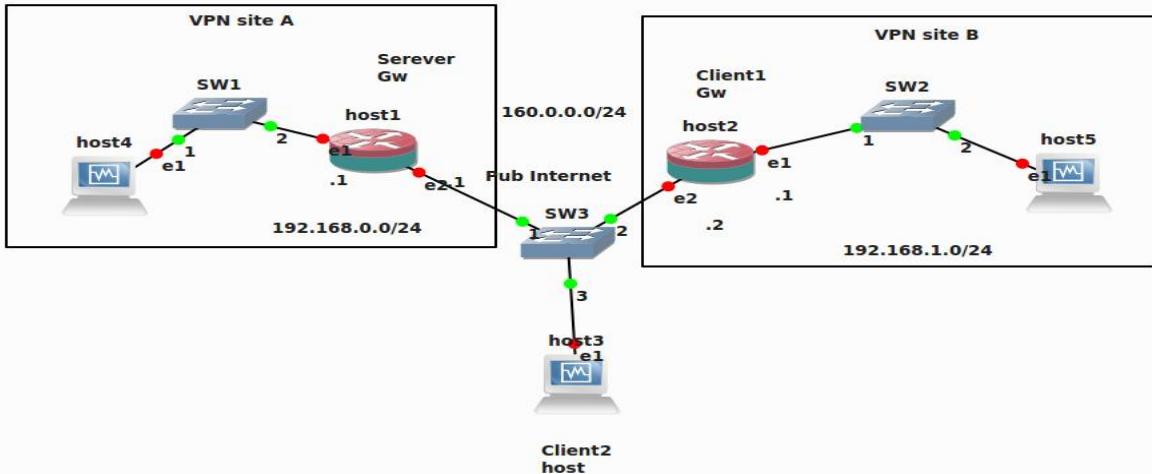

aprire client2.conf e sostituire

```
ca ca.crt  
cert client.crt  
key client.key
```

con:

```
ca ca.crt  
cert client2.crt  
key client2.key
```

VPN

assicurarsi di avere installato sul proprio pc '**openssh-server**' altrimenti da terminale date il seguente comando:

```
paolo@paolo-Aspire-5750G:~$ sudo apt-get install openssh-server
```

configurazione Host1

box login: tc

```
tc@box:~$ ip a s
```

```
tc@box:~$ ip a s

PROMEMORIA

- `conf t` (abbreviazione di: config terminal) → serve per entrare nella modalità di configurazione del router CISCO;
- `end` (o `CTRL+C`) → serve per uscire dalla modalità di configurazione;
- per lanciare i comandi di troubleshooting:
 - nella modalità di config terminal anteporre il “do” (ad es.: `do show ip route`);
 - fuori dalla modalità config terminal non bisogna mettere il “do” (ad es.: `show ip route`);
- se non dovessimo ricordare come completare il comando utilizzare l’help tramite il punto interrogativo “?” per chiudere velocemente la lista che si aprirà digitare un qualunque tasto

```
R1#show ip route ?
Hostname or A.B.C.D Network to display information about or hostname
bgp Border Gateway Protocol (BGP)
connected Connected
dhcp Show routes added by DHCP Server or Relay
eigrp Enhanced Interior Gateway Routing Protocol (EIGRP)
isis ISO IS-IS
list IP Access list
mobile Mobile routes
do Do Dynamic Route
```

- per terminare un *ping* premere “`CTRL+C`”
- per terminare il *traceroute* premere “`CRT+6`”
- per salvare la configurazione del terminale:
uscire dalla modalità config terminal, digitare “`copy running-configuration startup-configuration`”, premere invio per due volte e salvare il progetto su GNS3
- per completare automaticamente una parola utilizzare il tasto TAB (le doppie frecce accanto alla lettera Q)
- per vedere la configurazione del terminale possiamo:
 - digitare “`show running-config`” oppure “`do show running-config`”
 - oppure tasto destro sull’icona del terminale e selezionare “`startup-config`”
- per cambiare il nome del dispositivo, tasto destro e selezionare “`change the hostname`”
- per aggiungere nuove interfacce sul dispositivo, tasto destro, `configure` e `slot`
- se dovessimo cambiare più nomi o aggiungere più interfacce su più dispositivi:
 - selezionare tramite il mouse, o tramite riquadro (come facevamo sul desktop di windows XP), i dispositivi e ripetere i penultimi due punti
- per tutti i comandi si può utilizzare l’abbreviazione (ad es. `show running-config` → `show run`)
- Comandi SCREEN:

<code>Ctrl+a n</code>	ci muoviamo tra gli screen
<code>Ctrl+a p</code>	
<code>Ctrl+a c</code>	creiamo un nuovo screen
<code>Ctrl+a "</code>	fa vedere le schermate aperte
<code>Ctrl+a S</code>	creo il multiscreen
<code>Ctrl+a tab</code>	ci muoviamo tra le diverse schermate
<code>Exit</code>	chiudiamo una bash
<code>Ctrl+a Q</code>	elimina gli split ma lascia solo la sessione da cui si lancia il comando

Per tutto il resto c’è [GOOGLE !!!](#)

CONFIGURAZIONE GNS3 & VIRTUALBOX

L'installazione semplice è quella tramite "Ubuntu Software Center" anche se utilizza una versione vecchiotta di GNS3.

Da " Ubuntu Software Center " installare " GNS3 " e " VirtulaBox ".

Aprire GNS3:

- selezionare:
 - edit
 - IOS images and
 - image file...caricare il file.image nel nostro caso c3745
 - apri
 - save (compare una riga nel menu image)
 - base config: selezionare baseconfig.txt (in modo da visualizzare tutto il percorso)
 - auto calculatation
 - save
 - test setting
 - close
- selezionare:
 - l'icona di virtual box (Show VirtualBox Manager)
 - file
 - importa applicazione virtuale
 - selezioniamo l'applicazione (base.ova)
 - avanti
 - inizializza nuovamente l'indirizzo MAC di tutte le schede di rete
 - importa
 - avremo la nostra prima macchina virtuale chiamata "base"
 - diamo avvia (la freccia verde che punta a destra)
 - inserendo "tc" effettuiamo il login alla macchina virtuale
 - per spegnere la macchina andiamo su "base" tasto destro, chiudi, spegni, spegni
 - sempre tasto destro su base, clona
 - host1, inizializza, avanti, clone completo, clona
 - ripetere per il numero di host da realizzare
 - chiudi
- edit
 - preference
 - virtual box
 - test setting
- virtualbox guest

- refresh vm list
- vm list:host1
- identifier name: host1
- spuntare tutte le voci tranne "show advanced options"
- save
- ripetere per tutti gli host cambiando il nome
- chiudere
- edit
 - preferences
 - terminal settings (se utilizzate ubuntu lasciare gnome terminal) (con altre versioni xterm)
selezionare Use apply
 - yes
 - ok

Verificare il corretto funzionamento:

- mettere due host
- collegarli
- selezionare play
- tasto dx sui due host
- selezionare console
- si dovrebbero aprire i terminali
